**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# Matplotlib tutorial

Nicolas P. Rougier - Euroscipy 2012 - Prace 2013 - Euroscipy 2013

[Introduction](#)  
[Simple plot](#)  
[Figures, Subplots, Axes and Ticks](#)  
[Other Types of Plots](#)  
[Beyond this tutorial](#)  
[Quick references](#)

## Note

There is now an accompanying [numpy tutorial](#).

This tutorial is based on Mike Müller's [tutorial](#) available from the [scipy lecture notes](#).

Sources are available [here](#). Figures are in the [figures](#) directory and all scripts are located in the [scripts](#) directory. Github repository is [here](#)

All code and material is licensed under a Creative Commons Attribution 3.0 United States License (CC-by)  
<http://creativecommons.org/licenses/by/3.0/us>

Many thanks to **Bill Wing** and **Christoph Deil** for review and corrections.

Introductory slides on scientific visualization are [here](#)

## Introduction

matplotlib is probably the single most used Python package for 2D-graphics. It provides both a very quick way to visualize data from Python and publication-quality figures in many formats. We are going to explore matplotlib in interactive mode covering most common cases.

## IPython and the pylab mode

---

IPython is an enhanced interactive Python shell that has lots of interesting features including named inputs and outputs, access to shell commands, improved debugging and many more. When we start it with the command line argument `--pylab` (`--pylab` since IPython version 0.12), it allows interactive matplotlib sessions that have Matlab/Mathematica-like functionality.

## pylab

---

pylab provides a procedural interface to the matplotlib object-oriented plotting library. It is modeled closely after Matlab(TM). Therefore, the majority of plotting commands in pylab have Matlab(TM) analogs with similar arguments. Important commands are explained with interactive examples.

## Simple plot

In this section, we want to draw the cosine and sine functions on the same plot. Starting from the default settings, we'll enrich the figure step by step to make it nicer.

First step is to get the data for the sine and cosine functions:

```
from pylab import *  
  
X = np.linspace(-np.pi, np.pi, 256, endpoint=True)  
C, S = np.cos(X), np.sin(X)
```

X is now a numpy array with 256 values ranging from  $-\pi$  to  $+\pi$  (included). C is the cosine (256 values) and S is the sine (256 values).

To run the example, you can type them in an IPython interactive session

```
$ ipython --pylab
```

This brings us to the IPython prompt:

```
IPython 0.13 -- An enhanced Interactive Python.  
?          -> Introduction to IPython's features.  
%magic     -> Information about IPython's 'magic' % functions.
```

```
help    -> Python's own help system.
object? -> Details about 'object'. ?object also works, ?? prints more.
```

```
Welcome to pylab, a matplotlib-based Python environment.
For more information, type 'help(pylab)'.
```

or you can download each of the examples and run it using regular python:

```
$ python exercice_1.py
```

You can get source for each step by clicking on the corresponding figure.

## Using defaults

---

Documentation  
plot tutorial  
plot() command

Matplotlib comes with a set of default settings that allow customizing all kinds of properties. You can control the defaults of almost every property in matplotlib: figure size and dpi, line width, color and style, axes, axis and grid properties, text and font properties and so on. While matplotlib defaults are rather good in most cases, you may want to modify some properties for specific cases.

```
from pylab import *

X = np.linspace(-np.pi, np.pi, 256, endpoint=True)
C,S = np.cos(X), np.sin(X)

plot(X,C)
plot(X,S)

show()
```

## Instantiating defaults

---

### Documentation

#### Customizing matplotlib

In the script below, we've instantiated (and commented) all the figure settings that influence the appearance of the plot. The settings have been explicitly set to their default values, but now you can interactively play with the values to explore their affect (see [Line properties](#) and [Line styles](#) below).

```
# Import everything from matplotlib (numpy is accessible via 'n
p' alias)
from pylab import *

# Create a new figure of size 8x6 points, using 80 dots per inc
h
figure(figsize=(8,6), dpi=80)

# Create a new subplot from a grid of 1x1
subplot(1,1,1)

X = np.linspace(-np.pi, np.pi, 256,endpoint=True)
C,S = np.cos(X), np.sin(X)

# Plot cosine using blue color with a continuous line of width
1 (pixels)
plot(X, C, color="blue", linewidth=1.0, linestyle="-")

# Plot sine using green color with a continuous line of width 1
(pixels)
plot(X, S, color="green", linewidth=1.0, linestyle="-")

# Set x limits
xlim(-4.0,4.0)

# Set x ticks
xticks(np.linspace(-4,4,9,endpoint=True))

# Set y limits
ylim(-1.0,1.0)

# Set y ticks
```

```
yticks(np.linspace(-1,1,5,endpoint=True))

# Save figure using 72 dots per inch
# savefig("exercice_2.png",dpi=72)

# Show result on screen
show()
```

## Changing colors and line widths

---

### Documentation

Controlling line properties  
Line API

First step, we want to have the cosine in blue and the sine in red and a slightly thicker line for both of them. We'll also slightly alter the figure size to make it more horizontal.

```
...
figure(figsize=(10,6), dpi=80)
plot(X, C, color="blue", linewidth=2.5, linestyle="-")
plot(X, S, color="red", linewidth=2.5, linestyle="-")
...
```

## Setting limits

---

### Documentation

xlim() command  
ylim() command

Current limits of the figure are a bit too tight and we want to make some space in order to clearly see all data points.

```
...
xlim(X.min()*1.1, X.max()*1.1)
ylim(C.min()*1.1, C.max()*1.1)
...
```

## Setting ticks

---

### Documentation

xticks() command  
yticks() command  
Tick container  
Tick locating and formatting

Current ticks are not ideal because they do not show the interesting values ( $+\pi, +\pi/2$ ) for sine and cosine. We'll change them such that they show only these values.

```
...
xticks([-np.pi, -np.pi/2, 0, np.pi/2, np.pi])
yticks([-1, 0, +1])
...
```

## Setting tick labels

---

### Documentation

Working with text  
xticks() command

Ticks are now properly placed but their label is not very explicit. We could guess that 3.142 is  $\pi$  but it would be better to make it explicit.

```
yticks() command
set_xticklabels()
set_yticklabels()
```

When we set tick values, we can also provide a corresponding label in the second argument list. Note that we'll use latex to allow for nice rendering of the label.

```
...
xticks([-np.pi, -np.pi/2, 0, np.pi/2, np.pi],
        [r'$-\pi$', r'$-\pi/2$', r'$0$', r'$+\pi/2$', r'$+\pi$']
)
yticks([-1, 0, +1],
        [r'$-1$', r'$0$', r'$+1$'])
...
```

## Moving spines

---

### Documentation

Spines

Axis container

Transformations tutorial

Spines are the lines connecting the axis tick marks and noting the boundaries of the data area. They can be placed at arbitrary positions and until now, they were on the border of the axis. We'll change that since we want to have them in the middle. Since there are four of them

(top/bottom/left/right), we'll discard the top and right by setting their color to none and we'll move the bottom and left ones to coordinate 0 in data space coordinates.

```
...
ax = gca()
ax.spines['right'].set_color('none')
ax.spines['top'].set_color('none')
ax.xaxis.set_ticks_position('bottom')
ax.spines['bottom'].set_position(('data',0))
ax.yaxis.set_ticks_position('left')
ax.spines['left'].set_position(('data',0))
...
```

## Adding a legend

---

### Documentation

[Legend guide](#)

[legend\(\) command](#)

[Legend API](#)

Let's add a legend in the upper left corner. This only requires adding the keyword argument label (that will be used in the legend box) to the plot commands.

```
...
plot(X, C, color="blue", linewidth=2.5, linestyle="-", label="c
osine")
plot(X, S, color="red", linewidth=2.5, linestyle="-", label="s
ine")

legend(loc='upper left')
...
```

## Annotate some points

---

### Documentation

Let's annotate some interesting points using the annotate command.

We chose the  $2\pi/3$  value and we want to annotate both the sine and the cosine. We'll first draw a marker on the curve as well as a straight dotted line. Then, we'll use the `annotate` command to display some text with an arrow.

```
...
t = 2*np.pi/3
plot([t,t],[0,np.cos(t)], color='blue', linewidth=2.5, linestyle="--")
scatter([t],[np.cos(t)], 50, color='blue')

annotate(r'$\sin(\frac{2\pi}{3})=\frac{\sqrt{3}}{2}$',
        xy=(t, np.sin(t)), xycoords='data',
        xytext=(+10, +30), textcoords='offset points', fontsize=16,
        arrowprops=dict(arrowstyle="->", connectionstyle="arc3", rad=.2))

plot([t,t],[0,np.sin(t)], color='red', linewidth=2.5, linestyle="--")
scatter([t],[np.sin(t)], 50, color='red')

annotate(r'$\cos(\frac{2\pi}{3})=-\frac{1}{2}$',
        xy=(t, np.cos(t)), xycoords='data',
        xytext=(-90, -50), textcoords='offset points', fontsize=16,
        arrowprops=dict(arrowstyle="->", connectionstyle="arc3", rad=.2))
...
```

## Devil is in the details

The tick labels are now hardly visible because of the blue and red lines. We can make them bigger and we can also adjust their properties such that they'll be rendered on a semi-transparent white background. This will allow us to see both the data and the labels.

```
...
```

## Figures, Subplots, Axes and Ticks

So far we have used implicit figure and axes creation. This is handy for fast plots. We can have more control over the display using figure, subplot, and axes explicitly. A figure in matplotlib means the whole window in the user interface. Within this figure there can be subplots. While subplot positions the plots in a regular grid, axes allows free placement within the figure. Both can be useful depending on your intention. We've already worked with figures and subplots without explicitly calling them. When we call plot, matplotlib calls gca() to get the current axes and gca in turn calls gcf() to get the current figure. If there is none it calls figure() to make one, strictly speaking, to make a subplot(111). Let's look at the details.

### Figures

A figure is the windows in the GUI that has "Figure #" as title. Figures are numbered starting from 1 as opposed to the normal Python way starting from 0. This is clearly MATLAB-style. There are several parameters that determine what the figure looks like:

Argument	Default	Description
num	1	number of figure
figsize	figure(figsize)	figure size in inches (width, height)
dpi	figure.dpi	resolution in dots per inch
facecolor	figure.facecolor	color of the drawing background
edgecolor	figure.edgecolor	color of edge around the drawing background
frameon	True	draw figure frame or not

The defaults can be specified in the resource file and will be used most of the time. Only the number of the figure is frequently changed.

When you work with the GUI you can close a figure by clicking on the x in the upper right corner. But you can close a figure programmatically by calling `close`. Depending on the argument it closes (1) the current figure (no argument), (2) a specific figure (figure number or figure instance as argument), or (3) all figures (all as argument).

As with other objects, you can set figure properties also setp or with the `set_something` methods.

## Subplots

---

With `subplot` you can arrange plots in a regular grid. You need to specify the number of rows and columns and the number of the plot. Note that the `gridspec` command is a more powerful alternative.

```
subplot(2,1,1)
```

```
subplot(2,1,2)
```

subplot(1,2,1)

subplot(1,2,2)

subplot(2,2,1)

subplot(2,2,2)

subplot(2,2,3)

subplot(2,2,4)

Axes 1

Axes 2

Axes 3

Axes 4

Axes 5

## Axes

---

Axes are very similar to subplots but allow placement of plots at any location in the figure. So if we want to put a smaller plot inside a bigger one we do so with axes.

## Ticks

---

Well formatted ticks are an important part of publishing-ready figures. Matplotlib provides a totally configurable system for ticks. There are tick locators to specify where ticks should appear and tick formatters to give ticks the appearance you want. Major and minor ticks can be

located and formatted independently from each other. Per default minor ticks are not shown, i.e. there is only an empty list for them because it is as NullLocator (see below).

## Tick Locators

There are several locators for different kind of requirements:

Class	Description
NullLocator	No ticks.
IndexLocator	Place a tick on every multiple of some base number of points plotted.
FixedLocator	Tick locations are fixed.
LinearLocator	Determine the tick locations.
MultipleLocator	Set a tick on every integer that is multiple of some base.
AutoLocator	Select no more than n intervals at nice locations.
LogLocator	Determine the tick locations for log axes.

All of these locators derive from the base class `matplotlib.ticker.Locator`. You can make your own locator deriving from it. Handling dates as ticks can be especially tricky. Therefore, `matplotlib` provides special locators in `matplotlib.dates`.

## Other Types of Plots

**REGULAR PLOT**  
PLOT LINES AND/OR MARKERS

**SCATTER PLOT**  
MAKE A SCATTER PLOT OF X VERSUS Y

**BAR PLOT**  
MAKE A BAR PLOT WITH RECTANGLES

**CONTOUR PLOT**  
DRAW CONTOUR LINES AND FILLED CONTOURS

**IMSHOW**  
DISPLAY AN IMAGE TO CURRENT AXES

**QUIVER PLOT**  
PLOT A 2-D FIELD OF ARROWS

**PIE CHART**  
MAKE A PIE CHART OF AN ARRAY

**GRID**  
DRAW TICKS AND GRID

**MULTILOT**  
PLOT SEVERAL PLOTS AT ONCE

### POLAR AXIS

PLOT ANYTHING USING POLAR AXIS

### 3D PLOTS

PLOT 2D OR 3D DATA

### TEXT

DRAW ANY KIND OF TEXT

$$E = mc^2 = \sqrt{m_0^2 c^4 + p^2 c^2}$$
$$G \frac{m_1 m_2}{r^2} W_{\delta_1 \rho_1 \sigma_2}^{3\beta} = U_{\delta_1 \rho_1}^{3\beta} + \frac{1}{8\pi^2} \int_{\alpha_2} d\alpha_2'$$
$$\vec{v} = \int_{\alpha_2} \vec{p} + \mu \nabla^2 \vec{v} + \rho \vec{g}$$
$$E = mc^2 = \sqrt{m_0^2 c^4 + p^2 c^2}$$
$$F = G \frac{m_1 m_2}{r^2}$$
$$e^{-x^2} dx = \sqrt{\pi}$$
$$E = mc^2 = \sqrt{m_0^2 c^4 + p^2 c^2}$$

## Regular Plots

### Hints

You need to use the `fill_between` command.

Starting from the code below, try to reproduce the graphic on the right taking care of filled areas:

```
from pylab import *  
  
n = 256  
X = np.linspace(-np.pi, np.pi, n, endpoint=True)  
Y = np.sin(2*X)  
  
plot(X, Y+1, color='blue', alpha=1.00)  
plot(X, Y-1, color='blue', alpha=1.00)  
show()
```

Click on figure for solution.

## Scatter Plots

### Hints

Color is given by angle of (X,Y).

Starting from the code below, try to reproduce the graphic on the right taking care of marker size, color and transparency.

```
from pylab import *  
  
n = 1024  
X = np.random.normal(0,1,n)  
Y = np.random.normal(0,1,n)  
  
scatter(X,Y)  
show()
```

Click on figure for solution.

## Bar Plots

### Hints

You need to take care of text alignment.

Starting from the code below, try to reproduce the graphic on the right by adding labels for red bars.

```
from pylab import *
n = 12
X = np.arange(n)
Y1 = (1-X/float(n)
) * np.random.unif
orm(0.5,1.0,n)
Y2 = (1-X/float(n)) * np.random.uniform(0.5,1.0,n)

bar(X, +Y1, facecolor='#9999ff', edgecolor='white')
bar(X, -Y2, facecolor='#ff9999', edgecolor='white')

for x,y in zip(X,Y1):
    text(x+0.4, y+0.05, '%.2f' % y, ha='center', va='bottom')

ylim(-1.25,+1.25)
show()
```

Click on figure for solution.

## Contour Plots

### Hints

You need to use the `clabel` command.

Starting from the code below, try to reproduce the graphic on the right taking care of the colormap (see [Colormaps](#) below).

```
from pylab import *
def f(x,y): return
(1-x/2+x**5+y**3)
*np.exp(-x**2-y**2)

n = 256
x = np.linspace(-3,3,n)
y = np.linspace(-3,3,n)
X,Y = np.meshgrid(x,y)

contourf(X, Y, f(X,Y), 8, alpha=.75, cmap='jet')
```

```
C = contour(X, Y, f(X,Y), 8, colors='black', linewidth=.5)
show()
```

Click on figure for solution.

## Imshow

### Hints

You need to take care of the origin of the image in the imshow command and use a colorbar

Starting from the code below, try to reproduce the graphic on the right taking care of colormap, image interpolation and origin.

```
from pylab import *

def f(x,y): return
    (1-x/2+x**5+y**3)*np.exp(-x**2-y**2)

n = 10
x = np.linspace(-3,3,4*n)
y = np.linspace(-3,3,3*n)
X,Y = np.meshgrid(x,y)
imshow(f(X,Y)), show()
```

Click on figure for solution.

## Pie Charts

### Hints

You need to modify Z.

Starting from the code below, try to reproduce the graphic on the right taking care of colors and slices size.

```
from pylab import *

n = 20
Z = np.random.uniform(0,1,n)
pie(Z), show()
```

Click on figure for solution.

## Quiver Plots

---

### Hints

You need to draw arrows twice.

Starting from the code above, try to reproduce the graphic on the right taking care of colors and orientations.

```
from pylab import *  
  
n = 8  
X,Y = np.mgrid[0:n  
,0:n]  
quiver(X,Y), show()  
)
```

Click on figure for solution.

## Grids

---

Starting from the code below, try to reproduce the graphic on the right taking care of line styles.

```
from pylab import *  
  
axes = gca()  
axes.set_xlim(0,4)  
axes.set_ylim(0,3)  
axes.set_xticklabels([])  
axes.set_yticklabels([])  
  
show()
```

Click on figure for solution.

## Multi Plots

---

### Hints

You can use several subplots with different partition.

Starting from the code below, try to reproduce the graphic on the right.

```
from pylab import *  
  
subplot(2,2,1)  
subplot(2,2,3)  
subplot(2,2,4)  
  
show()
```

Click on figure for solution.

## Polar Axis

### Hints

You only need to modify the axes line

Starting from the code below, try to reproduce the graphic on the right.

```
from pylab import *  
  
axes([0,0,1,1])  
  
N = 20  
theta = np.arange(  
0.0, 2*np.pi, 2*np.  
.pi/N)  
radii = 10*np.rand  
om.rand(N)  
width = np.pi/4*np.random.rand(N)  
bars = bar(theta, radii, width=width, bottom=0.0)  
  
for r,bar in zip(radii, bars):  
    bar.set_facecolor( cm.jet(r/10.))  
    bar.set_alpha(0.5)  
  
show()
```

Click on figure for solution.

## 3D Plots

Starting from the code below, try to reproduce the graphic on the right.

```
from pylab import *
```

### Hints

You need to use `contourf`

```
from mpl_toolkits.  
mplot3d import Axes3D  
s3D
```

```
fig = figure()  
ax = Axes3D(fig)  
X = np.arange(-4,  
4, 0.25)  
Y = np.arange(-4,  
4, 0.25)  
X, Y = np.meshgrid  
(X, Y)  
R = np.sqrt(X**2 +  
Y**2)  
Z = np.sin(R)  
  
ax.plot_surface(X,  
Y, Z, rstride=1, cstride=1, cmap='hot')  
  
show()
```

Click on figure for solution.

## Text

### Hints

Have a look at the [matplotlib](#) logo.

Try to do the same from scratch !

Click on figure for solution.

$$\frac{dp}{dt} = \frac{d}{dt} \left[ \frac{m_0 \vec{v}}{\sqrt{1 - \frac{v^2}{c^2}}} \right] = \frac{m_0}{\sqrt{1 - \frac{v^2}{c^2}}} \left[ \frac{d\vec{v}}{dt} + \frac{\vec{v} \cdot \frac{d\vec{v}}{dt}}{c^2} \vec{v} \right]$$
$$F = \frac{d}{dt} \left[ \frac{m_0 \vec{v}}{\sqrt{1 - \frac{v^2}{c^2}}} \right] = \frac{m_0}{\sqrt{1 - \frac{v^2}{c^2}}} \left[ \frac{d\vec{v}}{dt} + \frac{\vec{v} \cdot \frac{d\vec{v}}{dt}}{c^2} \vec{v} \right]$$
$$F_G = G \frac{m_1 m_2}{r^2}$$
$$E = mc^2 = \sqrt{m_0^2 c^4 + p^2 c^2}$$

## Beyond this tutorial

Matplotlib benefits from extensive documentation as well as a large community of users and developers. Here are some links of interest:

## Code documentation

---

The code is fairly well documented and you can quickly access a specific command from within a python session:

```
>>> from pylab import *
>>> help(plot)
Help on function plot in module matplotlib.pyplot:

plot(*args, **kwargs)
  Plot lines and/or markers to the
  :class:`~matplotlib.axes.Axes`. *args* is a variable length
  argument, allowing for multiple *x*, *y* pairs with an
  optional format string. For example, each of the following
  is
  legal::

      plot(x, y)           # plot x and y using default line sty
  le and color
      plot(x, y, 'bo')    # plot x and y using blue circle mark
  ers
      plot(y)             # plot y using x as index array 0..N-
  1
      plot(y, 'r+')       # ditto, but with red plusses

  If *x* and/or *y* is 2-dimensional, then the corresponding c
  olumns
  will be plotted.
  ...
```

## Galleries

---

The [matplotlib gallery](#) is also incredibly useful when you search how to render a given graphic. Each example comes with its source.

A smaller gallery is also available [here](#).

## Mailing lists

---

Finally, there is a [user mailing list](#) where you can ask for help and a [developers mailing list](#) that is more technical.

# Quick references

Here is a set of tables that show main properties and styles.

## Line properties

Property	Description	Appearance
alpha (or a)	alpha transparency on 0-1 scale	
antialiased	True or False - use antialiased rendering	<b>Aliased</b> Anti-aliased
color (or c)	matplotlib color arg	
linestyle (or ls)	see <a href="#">Line properties</a>	
linewidth (or lw)	float, the line width in points	
solid_capstyle	Cap style for solid lines	
solid_joinstyle	Join style for solid lines	
dash_capstyle	Cap style for dashes	
dash_joinstyle	Join style for dashes	
marker	see <a href="#">Markers</a>	
markeredgewidth (mew)	line width around the marker symbol	
markeredgewidth (mec)	edge color if a marker is used	
markerfacecolor (mfc)	face color if a marker is used	
markersize (ms)	size of the marker in points	

## Line styles

Symbol	Description	Appearance
-	solid line	
--	dashed line	
-.	dash-dot line	
:	dotted line	
.	points	
,	pixels	
o	circle	
^	triangle up	
v	triangle down	
<	triangle left	
>	triangle right	
s	square	
+	plus	
x	cross	
D	diamond	
d	thin diamond	
1	tripod down	
2	tripod up	
3	tripod left	
4	tripod right	
h	hexagon	
H	rotated hexagon	
p	pentagon	
	vertical line	
_	horizontal line	

## Markers

Symbol	Description	Appearance
0	tick left	
1	tick right	
2	tick up	
3	tick down	
4	caret left

## Colormaps

---

All colormaps can be reversed by appending `_r`. For instance, `gray_r` is the reverse of `gray`.

If you want to know more about colormaps, check [Documenting the matplotlib colormaps](#).
