SG6: Dec. 2021 – Jan. 2022

Slide deck 1: the language

Course outline

- **Bond graph objectives**
- **The bond graph language**
 - Bonds and power variables: the physical analogy
 - Elements
- Practice: reading & creating bond graphs
- Causality and derivation of mathematical models

Bond graph objectives

- a simple unified graphical language for many physical domains
- acausal models
 - to preserve the physical structure of the real physical system
 - which highlight energy exchange
- but with the (optional) superposition of a *computational causality* information

Bond graph model structure is *hybrid*

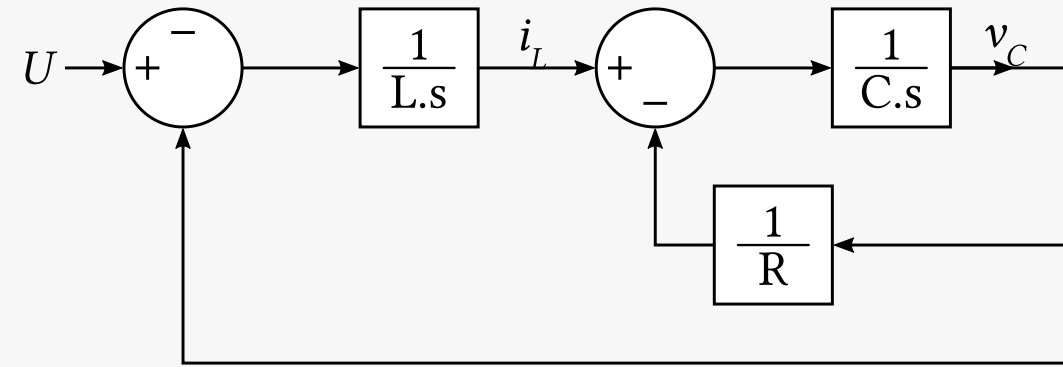

Two extremal structures of model:

1. Block diagrams, with very clear computational structure
 - but lost physical structure
2. Physical network-type diagrams (electrical, mechanical)
 - but no computational information

Model comparisons

BG, Circuit (acausal), Block diagram (causal)

The bond graph language

- Bonds & power variables
- Elements

Bonds

Bonds model the physical interaction of **two** elements which **exchange energy**.

The interaction happens through two generalized physical variables: *effort* & *flow*, collectively named the “power variables”.

Physical analogy in bond graphs

Each physical domain has a specific choice for the generalized *effort* and *flow* variables of each bond:

	Effort e	Flow f
Translational mechanics	Force F (N)	Velocity v (m/s)
Rotational mechanics	Torque Γ (N.m)	Angular velocity ω (rad/s)
Electricity	Voltage u (V)	Current i (A)
Thermal transfers	Temperature T (K)	Entropy flow rate \dot{S} (J/K/s)
Hydraulic	Pressure P (N/m ²)	Volume flow rate Q_v (m ³ /s)

Property: the two variables of each bond are chosen such that:

$$Effort \times Flow = Power \text{ (Watt)}$$

Reminder: Modelica's physical analogy

Modelica's analogy is based on the port's *connection* behavior

	Potential	Flow
Translat. mech.	Position s (m)	Force f (N)
Rotational mech.	Angular position φ (rad)	Torque Γ (N.m)
Electricity	Voltage u (V)	Current i (A)
Thermal transfers	Temperature T (K)	Heat flow Q (J/s=W)
Hydraulic	Pressure P (N/m ²)	Mass flow rate Q_m (kg/s)

$$\begin{aligned} V_1 &= V_2 = V_3 \\ i_1 + i_2 + i_3 &= 0 \end{aligned}$$

⚠ Differences with bond graph:

- Force and Torque are **switched**: BG's Effort \rightarrow Modelica's Flow
- Different vocabulary in **bold**: in particular position vs speed

Comparison with Modelica's analogy

BG & Modelica:

- both introduce an analogy between variables across different physical domains
- but using a different **classification** & **vocabulary**, because each is built on different foundations

BG's analogy: group variables as “*effort*” or “*flow*”

- by *preserving common physical sense* (ex.: voltage \leftrightarrow force, current \leftrightarrow speed)
- with constraint $e \times f = \text{Power}$

Modelica's analogy: group variables as “*potential*” or “*flow*”

- by *preserving the connection topology* of graphical diagrams (ex.: voltage \leftrightarrow position because both are equal at interconnection of ports)
- (with no constraint on the product $e \times f$)

Relation between BG's and Modelica's analogies

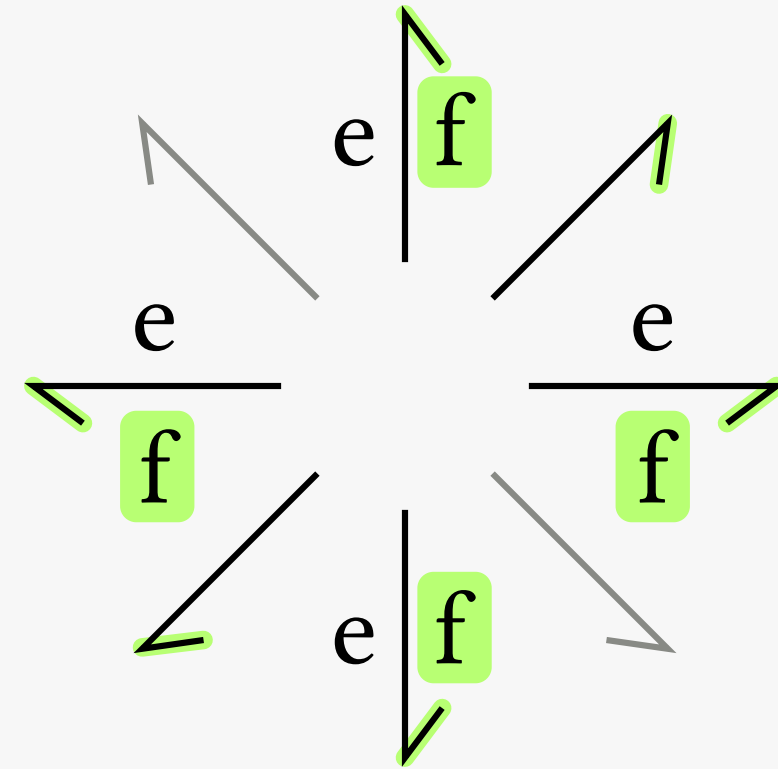

Domain	Mechanics	Others (e.g. electricity)
BG effort	Mod flow	Mod potential
BG flow	Mod der(potential)	Mod flow (*)

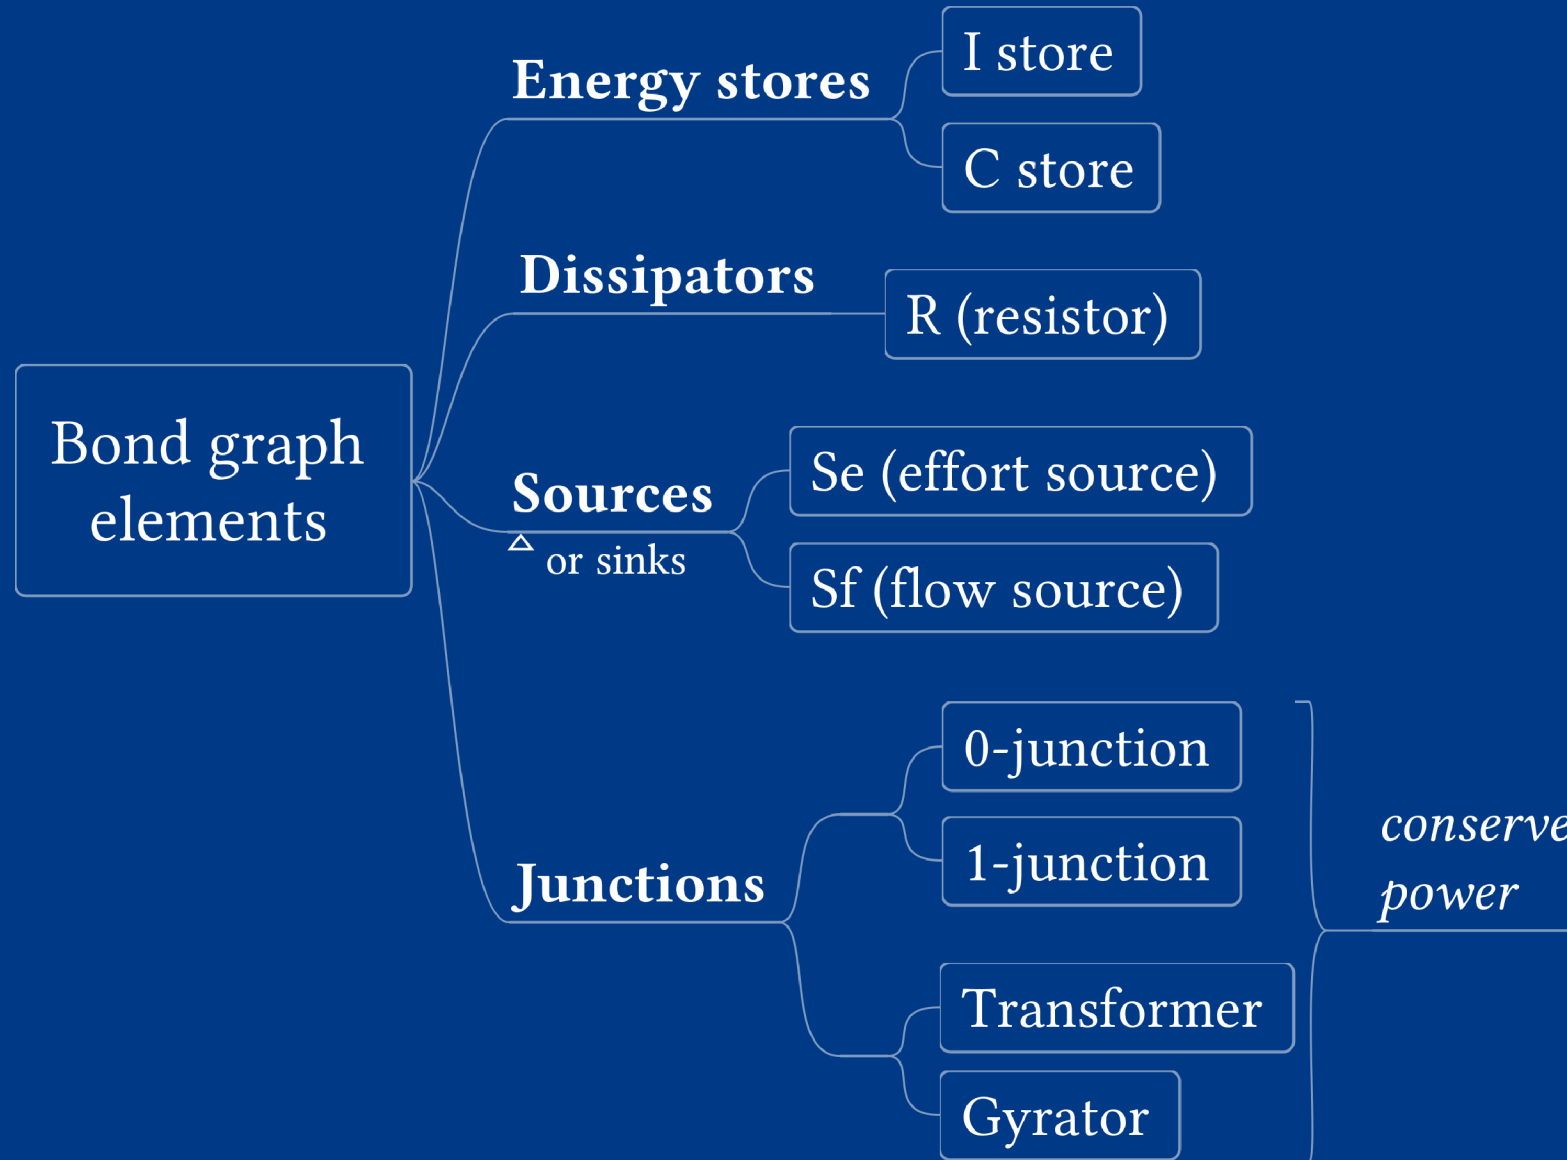

Observations:

- for all domains except mechanics, we have:
 - BG effort = Modelica potential
 - BG flow = Modelica flow (*)
- but for mechanics:
 - it's reversed
 - and we have an extra derivative: speed = der(position)
- (*) thermal domain is an exception : heat flow (J/s) vs entropy flow (J/K/s)

Bonds

- Exchange of energy between elements
- Half arrow = direction of positive power flow
- Drawing conventions:
 - e above/left, f below/right
 - half arrow on the side of the flow (i.e. below/right)

Junctions

Unlike in network-type diagrams, the connection of elements is not achieved with the topology of links (e.g. loops of wires), but using explicitly one of the two junction elements:

- “0” junction: common effort
- “1” junction: common flow

Also in the junction category: transformers and gyrators

Common property: **instantaneous power is conserved**

0 junction

“Common effort” junction:

$$e_1 = e_2 = \dots = e_n$$

Flows are distributed (incoming sum = outgoing sum), according to the *orientation* of the bonds.

On the example:

$$f_1 = f_2 + \dots + f_n$$

1 junction

“Common flow” junction:

$$f_1 = f_2 = \dots = f_n$$

Efforts are distributed (incoming sum = outgoing sum), according to the *orientation* of the bonds.

On the example:

$$e_1 = e_2 + \dots + e_n$$

Two-port junctions: transformers & gyrators

Transmit power with a scaling of efforts & flows:

- in the same domain (unitless scaling)
- between two domains (scaling with a physical unit)

Transformer (TF)

$$f_2 = m \cdot f_1$$

$$m \cdot e_2 = e_1$$

m is the transformer ratio

Examples:

- Mechanical gear pair: $\omega_2 = (r_2/r_1) \cdot \omega_1$
- Cable – Pulley: $v = r \cdot \omega$
- Electrical **transformer**: $v_1 = m \cdot v_2$ (⚠ inverted definition of the transformer ratio)

Gyrator (GY)

$$e_2 = r \cdot f_1$$

$$e_1 = r \cdot f_2$$

r is the gyrator ratio

Example:

- EMF of a DC motor: $e = K \cdot \Omega$ and $C = K \cdot i$

Modulation of Transformers (Gyrators)

The transformer (gyrator) can be *modulated by a signal* (using a *signal arrow* \rightarrow):

Examples: crank-slider mechanism, averaged DC-DC converter.

One-port elements

There are 3 basic energy consuming/storing devices:

- Dissipator: **R**esistor
- Energy stores:
 - **C** store, also called **C**ompliance or **C**apacitor
 - **I** store, also called **I**ntertia

In addition, there are two sources: **S_e** (effort) and **S_f** (flow source)

Remark: in electricity, *one-port* element = device with *two* electrical pins

Resistor (R)

Relation (linear case):

$$e = R.f$$

Property: power is irreversibly dissipated (as heat)

Examples:

- Electrical resistor: $u = R.i$
- Mechanical damper: $f = d.v$

C energy store (also called Compliance or Capacitor)

Using the “generalized displacement” q (an “energy” variable):

$$q = \int f \cdot dt$$

C store relation:

$$q = \Phi_C(e)$$

Linear C store:

$$q = C \cdot e$$

→ consequence: $f = C \cdot de/dt$

C store examples (linear)

Mechanics:

- displacement = (kinematic) displacement $x = \int v \cdot dt$
- relation: $x = (1/k) \cdot f$
- C store = **spring**

Electricity:

- displacement = charge $q = \int i \cdot dt$ (Coulomb)
- relation $q = C \cdot u$
- C store = (electrical) **capacitor**

I energy store (also called Inertia)

Using the “generalized momentum” p (an “energy” variable):

$$p = \int e \cdot dt$$

I store relation:

$$p = \Phi_I(f)$$

Linear I store:

$$p = I \cdot f$$

→ consequence: $e = I \cdot df/dt$

I store examples (linear)

Mechanics:

- momentum = mechanical momentum $p = \int f \cdot dt$
- relation: $p = m \cdot v$, that is $f = m \cdot dv/dt$ (inertial force)
- I store = mechanical **inertia**

Electricity:

- momentum = magnetic flux linkage $\lambda = \int u \cdot dt$ (V.s = Wb)
- relation: $\lambda = L \cdot i$, that is $v = L \cdot di/dt$
- I store = **inductor**

Parametrization of R, C, I elements

The value of a linear R/C/I element is appended with the notation “: x ”.

Same notation is used for the value of a source (next slide).

Sources

Sources either impose the effort (**Se**) or the flow (**Sf**).

Se examples:

- Electricity: voltage source
- Mechanics: imposed torque or force

Sf examples:

- Electricity: current source
- Mechanics: imposed speed

Bond Graphs practice

A graphical language for the analysis of multiphysical systems

SG6: Dec. 2021 – Jan. 2022

Slide deck 2: practice

Course outline

- Bond graph objectives
- The bond graph language
 - Bonds and power variables: the physical analogy
 - Elements
- **Practice: reading & creating bond graphs**
- Causality and derivation of mathematical models

Practice

Objectives: being able to

1. **Read** BGs

- recognize classical structure

2. **Create** BGs from network diagrams (electrical, mechanical)

M1: 1 junctions represent “velocity points”

Questions:

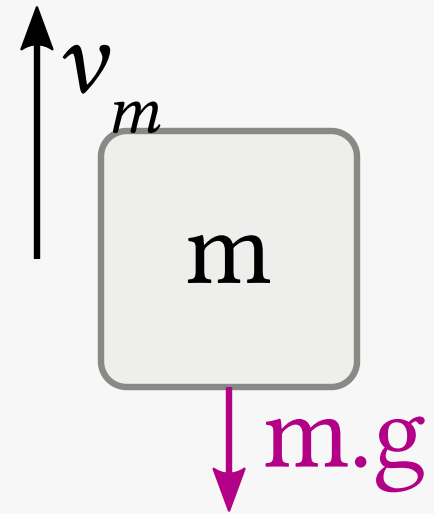

- Fill the blanks on the BG
- Represent the physical system
- Derive the overall mechanical equation of the system

M1: 1 junctions represent “velocity points” (S)

This BG represents the **free fall** of a mass m with equation:

$$m \cdot \frac{dv_m}{dt} = -m \cdot g$$

M2: Springs and dampers typically on 0 junctions

Questions:

- Fill the blanks on the BG
- Represent the physical system
- Give the expression of F_k

M2: Springs and dampers typically on 0 junctions (Sol.)

This BG represents a spring of stiffness k between two points A and B.

$$F_k = k \int (v_a - v_b) \cdot dt = k(x_a - x_b)$$

Mechanical BGs: main structures

- velocity points represented by 1 junction
 - an Inertia can attach directly to its corresponding 1 junction
- components which reacts on a velocity/position differences (spring and dampers) are typically connected to a *0 junction placed between two 1 junctions*

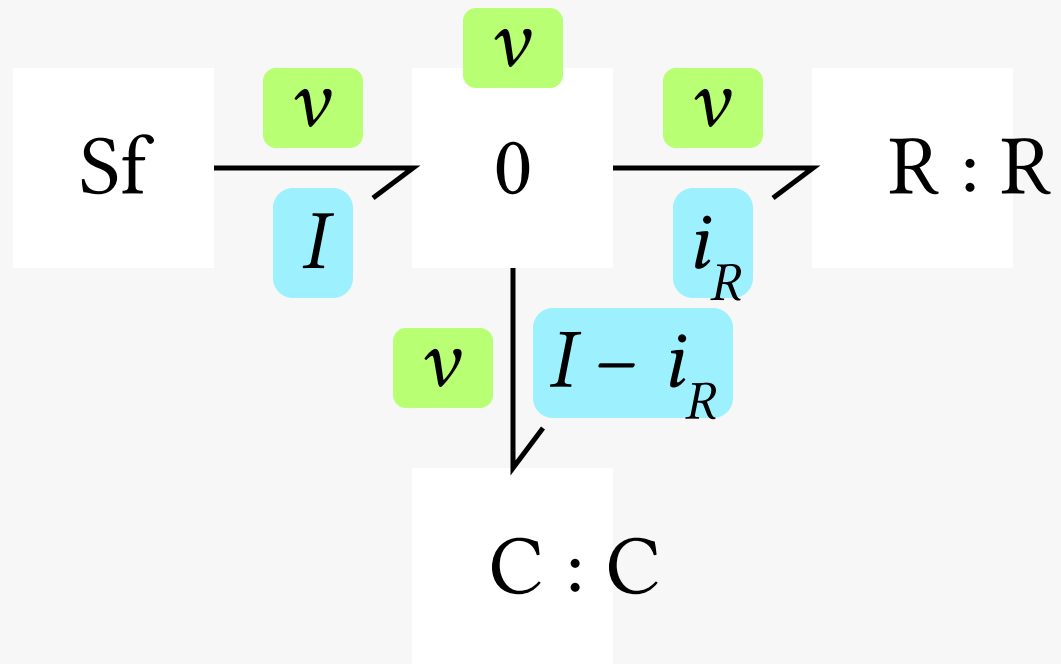

E1: 0 junctions represent voltage nodes

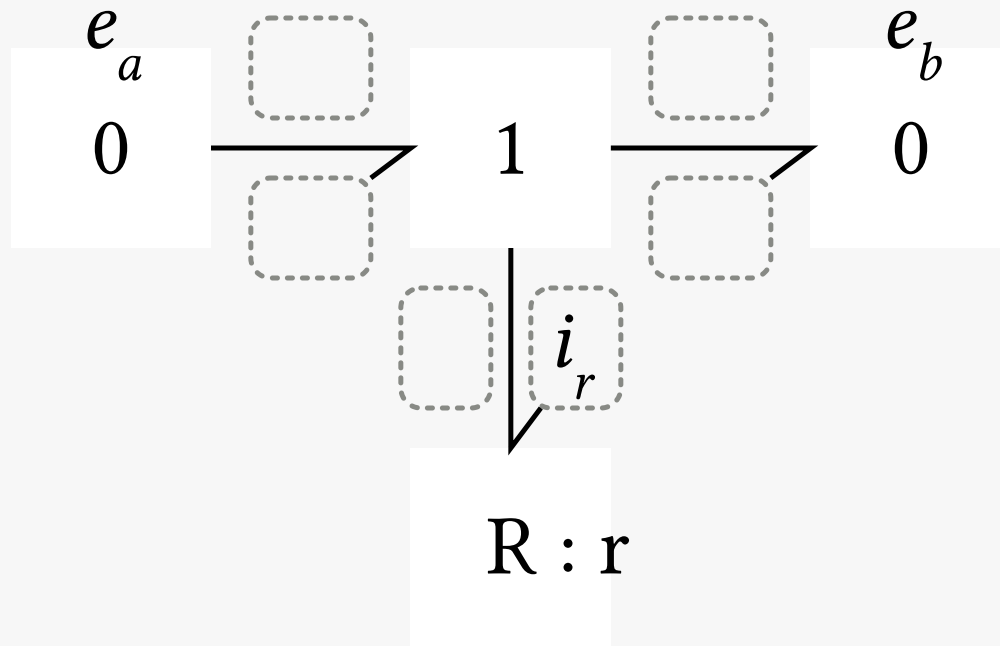

Questions:

- Fill the blanks on the BG
- Represent the physical system

E1: 0 junctions represent voltage nodes (Sol.)

E2: 1 junction for voltage drop on a RLC component

Questions:

- Fill the blanks on the BG
- Represent the physical system
- Compute i_r

E2: 1 junction for voltage drop on a RLC component (Sol.)

$$i_r = (e_a - e_b)/r$$

E3: Voltage source

...

Bond Graphs practice

→

Pierre Haessig, CentraleSupélec (campus of Rennes)

SG6: Dec. 2021 – Jan. 2022

Slide deck 3: causality

Course outline

- Bond graph objectives
- The bond graph language
 - Bonds and power variables: the physical analogy
 - Elements
- Practice: reading & creating bond graphs
- Causality and derivation of mathematical models
 - **Principles**
 - Practice

Computational causality & derivation of mathematical models

Causally completed bonds

Reminder: bonds express acausal physical links between components

Optionnaly, bonds can be completed with “**causality stroke/arrow**” which indicate the direction of the computation flow.

Remark: this *computational* causality doesn't express a *physical* cause → consequence relationship

Meaning and significance of causality in BGs

BG to block diagrams fragments

Mnemonic: the causality arrow is the direction of the *effort signal arrow*

To be continued...

Rules for each class of BG components

- sources
- junctions
- energy stores & dissipators

Causality for Sources

For sources, causality orientation is **compulsory**:

- S_e imposes the effort
→ outgoing effort
- S_f imposes the flow
→ outgoing flow

Causality for junctions: 0 junction

Compulsory rule

For 0 junction (share effort): *“One and only one incoming effort”*

Remark: causality arrows unrelated to bond orientations

Causality for junctions: 1 junction

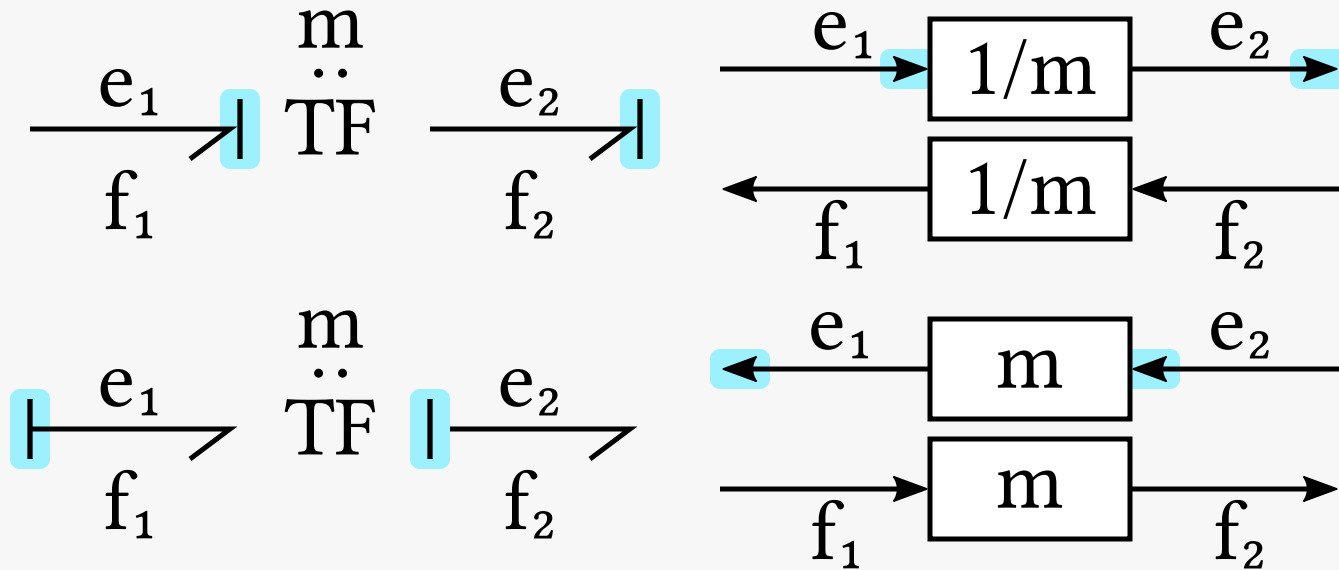

Compulsory rule

For 1 junction (share flow): *“One and only one incoming flow”*

Remark: causality arrows unrelated to bond orientations

Causality for junctions: TF

[Compulsory] Transformers **preserve** the direction of the e&f signals

- one incoming effort
- one incoming flow

Causality for junctions: GY

[Compulsory] Gytrators **reverse** the direction of the e&f signals

- either two incoming efforts
- or two incoming flows

Causality for Energy stores

C and I energy stores can accept the two possible causalities:

- **Integral causality** is the one yielding an integrator block
- **Derivative causality** is the one yielding an derivator block

For computational easiness, integrators are preferred, so
Integral causality = **Preferred** causality

Causality for Energy stores: C

Integral causality: receives a flow, imposes an effort

- Capacitor: current \rightarrow voltage
- Spring: speed/position \rightarrow force

Causality for Energy stores: I

Integral causality: receives a flow, imposes an effort

- Inductor: voltage \rightarrow current
- Intertia: force \rightarrow speed

Causality for R (dissipators)

For dissipators, all orientations are fine.

Sometimes called “resistance” vs
“conductance” causality

Sequential assignement rules

SCAP procedure:

Rule 1: assign sources

Rule 2: assign integral causality to Energy stores

Causality assignment examples

- Ex1: Rule 1 (sources+propagation) is enough
- Ex2: Rule 1+2 (preferred causality for energy stores) are enough

Bond Graphs practice

A graphical language for the analysis of multiphysical systems

SG6: Dec. 2021 – Jan. 2022

Slide deck 4: causality practice

Course outline

- Bond graph objectives
- The bond graph language
 - Bonds and power variables: the physical analogy
 - Elements
- Practice: reading & creating bond graphs
- Causality and derivation of mathematical models
 - Principles
 - **Practice**

Causality assignment Ex1

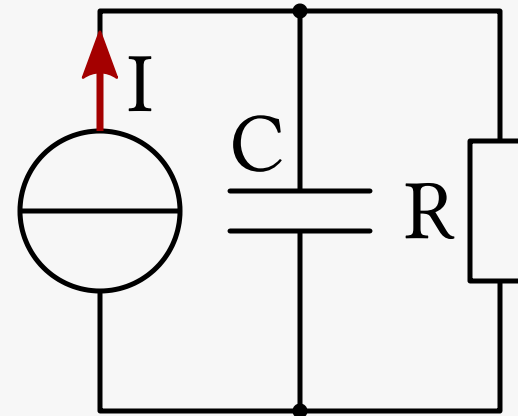

Causality assignment Ex1 (Sol.)

1. $R1$: Se sets the effort on the 0 junction
2. Propagation: effort propagates through the 0 junction

Causality assignment Ex2

Causality assignment Ex2 (Sol.)

1. R1: Sf sets the flow on the 0 junction.
 - (no propagation)
2. R2: Set integral causality for C
 - \rightarrow C sets the effort on the 0 junction

3. Propagation of effort to R through the 0 junction

Impossible connections exercise

Impossible connections exercise (Sol.)

The physical impossibility of parallel voltage sources emerges as a **causality conflict** on the 0 junction (“only one incoming effort allowed”).
